

Exercise-1: Write a JavaScript program to link JavaScript file with the HTML page

We have two ways to link JavaScript with HTML: 1. Internal 2. External

1. Internal: using script tag.

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-
scale=1.0">
  <title>Document</title>
  <link rel="stylesheet" href="day2.css">
</head>
<body>
  <p>this is example for linking js with html using script tag
anywhere inside body and outside body</p>
</body>
<script>
alert("hello welcome to js")
</script>
</html>
```

Note: it is suggested to write script tag after closing body tag

2. Externally

Day2.html

```
<!DOCTYPE html>
<html lang="en">
<head>
  <meta charset="UTF-8">
  <meta name="viewport" content="width=device-width, initial-
scale=1.0">
  <title>Document</title>
  <link rel="stylesheet" href="day2.css">
</head>
<body>
  <form>
    <input id="username" type="text" placeholder="Enter your
name"> <br/>
    <button onclick="Example()">Click Me</button>
  </form>
</body>
<script src="day2.js">
</script>
```

```
</html>
```

Day2.js

```
function Example(){  
  console.log("working")  
  let name=document.getElementById("username").value  
  document.write("Hello"+name)  
}
```
